1. General Description of the System Administrator Service

gbl klub

love to support

Our IT support services are provided according to the ITIL principles developed for IT professionals. We keep your devices up-to-date, provide documentation and go through the necessary monthly maintenance. In case of a failure or a request, our operators provide a solution or escalate the task to our engineers, if needed. Our specialist solves the issue remotely through our remote management system or on site, at a mutually agreed time. Your dedicated IT contact person is aware of all your processes and you are free to have discussions either on the phone or personally. All work processes are fully administered from receiving the report to completion. Your report is received via your dedicated support e-mail or, in case of issues related to the mailing system or communication, by calling the provided phone number. In case of emergency stops outside working hours we are available through our emergency line. Our clients can monitor our monthly IT support activities via their access to the support ticket system or from the system reports. We provide a transparent view of IT systems presenting what to expect from an infrastructure and also what should not be expected from it. If necessary we work out proposals for system development in order to assure that the client's idea meets the IT solution. IT operation is successful when reasonable solutions are found both professionally and financially tailored to the demands and the size of the company.

Availability

- ✓ provision of ITIL-based services
- ✓ IT contact person
- ✓ IT infrastructure monitoring
- ✓ backup monitoring
- ✓ provision of licenses for the remote management system
